

Clean Energy Progress

Don't Drink the Kool-Aid

What Are Our Goals?

Market, policy and technology innovation that provides **clean, equitable, affordable** energy to address the ecological destruction of our planet

Question The Status Quo?

1. The future of generation is not your rooftop
2. Battery storage is great... sometimes
3. Most software in energy is incremental at best
4. Transportation needs MUCH more than electric cars
5. Natural gas is a big part of the solution
6. Tax credit financing is a gift to banks/lawyers at the expense of clean energy

DG - The Power Is Yours?

- The math doesn't pencil
- Business model built on a bad political bet
- Free insurance, brought to you by poor people

Electric Car = End of Oil... Soon?

- Global cars to double in next 20 years
- Old cars don't go away quickly
- \$20 oil and a used Chevy... the new developing economy dream
- Carbon impact = "it depends"

Outboard motor STILL IN USE – Vietnam fall 2015

Moving Forward

1. Markets in place of government dollars or technology
2. Focus on technologies that retrofit existing systems
3. Get politics out of regulation

Do the math.

Thank You.
